

Better patient care through fast, accurate and secure exchange of essential information

A secure, managed connection to the Health Intranet and Internet services enables confident information sharing between health partners for better patient care.

District Health Boards and health practitioners throughout New Zealand work every day to provide efficient and effective health care services. In line with the national health care strategy, health care professionals are also focused on finding ways to continually improve the health services they offer New Zealanders. This is presenting a number of challenges, such as:

- Maintaining continuity of care between partners in a patient's health care process.
- Transferring patient information between partners in a timely and secure manner.
- Gaining access to centralised clinical information and online health applications.
- Finding new ways to reduce administrative costs.

Opportunities to address these challenges, and deliver better health outcomes, exist through the online exchange of high-quality information between partners in the health care sector. However, the confidential nature of this information and the importance of it remaining uncorrupted, demand the highest levels of security.

Using your existing Internet service, SecureME for Health provides a cost-effective secure connection to the Health Network, so health care professionals can stay focused on quality patient or customer care.

For the public

- More efficient health care service.
- Fully-informed health care providers.
- Privacy is maintained.

For health practitioners

- Better health outcomes.
- Reduced IT administration.
- More time to focus on patient/customer care.

For health care organisations

- Improved service delivery to patients.
- Peace of mind through secure access to Health Network applications.
- Better view of the patient/customer.

SecureME

One solution for connection and security

SecureME for Health is designed to help improve health outcomes by bringing providers together in the secure online environment of the Health Network. Once you have an Internet connection in place, SecureME for Health can add the necessary security to it. And SecureME operates over most existing Internet services.

Enabling knowledge transfer

SecureME for Health provides a physical electronic network and related services to enable:

- The timely exchange of information between health organisations and practitioners.
- Access to information and applications on the Health Intranet, including the National Immunisation Register and National Health Index.
- Direct online communication between health care providers in multiple locations.

Trusted security

With its advanced security technology, and automated system management, SecureME for Health gives health care professionals the confidence to make full use of the benefits it has to offer.

Cost effective, secure, reliable

- Easy set-up and no up-front costs allow immediate use.
- Fixed monthly payments make budget management predictable for small business customers, such as general practitioners and pharmacists.
- Peace-of-mind security backed by a network management service.
- Free 0800 helpdesk support that includes technical help and remote support of your system, offering swift resolution of any technical issues and low cost technical maintenance that doesn't involve your time.
- Administration of your system is included in the service, with the option to self-manage if you prefer.
- If you choose to self-manage, the centralised management system allows you to administer multiple locations through the SecureME website.
- Ability to control Internet access so you can further increase protection against outside intrusions.

The advantages of partnering with Gen-i

We're part of the health community

Gen-i is a member of the Health Network community as a trusted connection and security solution provider. We have an in-depth understanding of the challenges faced by large

health organisations as well as individual businesses and practices. Our focus is to develop and deliver cost-effective and robust business solutions for those challenges.
